

Agentic Cloud Security Control Tower

 Current Operational Bottleneck

Repetitive Triage: Hours lost justifying CVE vulnerabilities for CSA Tier 1 report.

Detection without solution: Container scanner merely identify the target container vulnerabilities without mitigation solution.

Disconnected with environment: Security Enterprise tools mitigation suggestions completely unaware of our hardened cloud configurations.

Knowledge Evaporation: Approved security risk decisions by Cyber Team vanish after the project ended.

 Hackathon MVP’s Scope

- Multi-Source Ingestion:** Ingests CIS policies, project architecture diagrams, cloud configs.
- Security assessment:** Container image vulnerability scan ingestion.
- Autonomous Drafting:** Fills mitigation and compliance rationales.
- Lead Gate:** One-click validation before persisting decisions.
- MCP/RAG Memory Store:** Retains Authority security risk acceptance to MCP/RAG to benefit future projects.

THE HACKATHON DEMO WORKFLOW

01 SCAN INGEST

Container Telemetry

Parses image CVE findings.

02 CONTEXT SYNTHESIS

Agent Reasoning

Generates mitigation rationale.

03 HUMAN APPROVAL

Authority Security Lead Gate

Human verification checkpoint.

04 PERSISTENCE

MCP/RAG Memory Store

Stores approved findings permanently.

3

Review Iterations
/ Report

4 Mo

Whole Process
/ Project

1 Mo

Per DSO
/ Tool for VA

Iterative Audit Friction: Average 3 review cycles per CSA Tier 1 report to finalize justifications.

Lengthy Release Delays: Entire compliance triage takes ~4 man-months per project lifecycle.

Heavy Recurring VA Load: Consumes ~1 man-month per DSO/App tool for Annual Vulnerability Assessments.

>70%

First-Pass Approval

Cost Savings at IBM

Direct reduction in engineering and security consulting man-hours across delivery squads. *(Validation survey will be conducted during the hackathon).*

Time Savings at Authority Side

Accelerated review turnaround for Authority Cyber Leads on reviewing justifications, slashing back-and-forth friction and approval delays.
